ABSTRACT

GreenCart – A Unified Agricultural Marketplace for Farmers, Dealers, and Customers is a web-based platform developed to address the challenges of the traditional agricultural supply chain, such as dependency on intermediaries, limited market access for farmers, inefficient inventory management, and the lack of a centralized system for agricultural commerce. The primary aim of the project is to provide a single digital platform that connects farmers, dealers, customers, delivery personnel, support staff, and administrators, ensuring transparent and efficient management of agricultural products and services. The proposed system enables farmers to list and manage fresh produce, dealers to maintain bulk inventory, customers to browse products, place orders, and view order status updates, while delivery personnel update order status, support staff handle customer queries, and administrators manage users, products, and overall platform operations. The expected outcome is to improve farmers' income, provide customers with fresh products at fair prices, streamline order and inventory management, and create a secure, transparent, and digitally empowered agricultural marketplace. The system will be developed using React.js, Bootstrap, HTML5, CSS, and JavaScript for the frontend, Node.js and Express.js for the backend, and MySQL as the relational database.
